

Last-FM* architecture and evaluation protocol

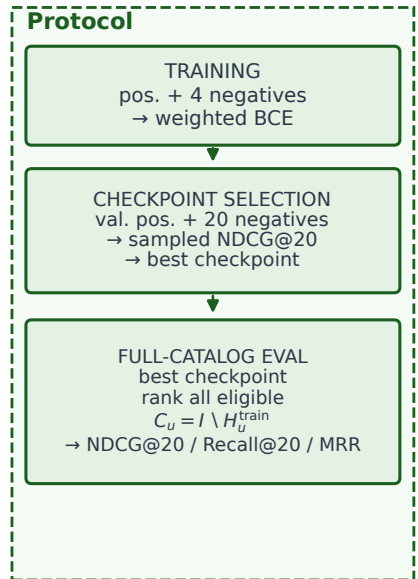

1 Inputs

2 Model

3 Training / evaluation

Legend

$\parallel$ = concatenation (not addition) · $\oplus$ = residual addition · A_{11}/ϕ : cross-fitted item-item association (Pearson ϕ ; for binary incidence $\equiv A_{11}$)

H3 and LEG_{K2} share the same Top25 routed associations; N_X enters A5 (set overlap), not the H3/LEG routing path.

Structural 257D = 256 + 1; fusion 265D = 257 + 5 + 3; LEG enters only as δ_{LEG} outside the 265D concat.
